European **C**entre for
Medium-range **W**eather
Forecast

- Research institution
- 24/7 operational service
- 22 member states
- 12 cooperating states
- 300 employees from more than 30 countries.

What do we do?

Much more than weather predictions...

Global forecasts and NWP science

We produce global scale ensemble-based analyses and predictions from few days up to a year ahead. And we constantly try to improve our model.

What do we do?

Much more than weather predictions...

Global forecasts and NWP science

We produce global scale ensemble-based analyses and predictions from few days up to a year ahead. And we constantly try to improve our model.

Environmental services

We developed a complete Earth system model to analyse and predict other aspects of the natural environment than purely the weather.

What do we do?

Much more than weather predictions...

Global forecasts and NWP science

We produce global scale ensemble-based analyses and predictions from few days up to a year ahead. And we constantly try to improve our model.

Environmental services

We developed a complete Earth system model to analyse and predict other aspects of the natural environment than purely the weather.

Serving meteorology

We provide world-leading weather forecasts, specialist software, and the largest meteorological data archive in the world.

Global forecasts and NWP science

We produce global scale ensemble-based analyses and predictions from few days up to a year ahead. And we constantly try to improve our model.

Environmental services

We developed a complete Earth system model to analyse and predict other aspects of the natural environment than purely the weather.

Serving meteorology

We provide world-leading weather forecasts, specialist software, and the largest meteorological data archive in the world.

Supercomputing

Improving the skill and detail of ECMWF predictions is a computationally expensive process.

My career path

A mixture of academic and industry experiences

What do I do @ECMWF?

Natural hazard modelling

EU project called
ANYWHERE to develop a

Multi-Hazard Early Warning System

to help respond more rapidly
to extreme climate and
weather events.

Floods and storm surges

Natural hazard modelling

EU project called ANYWHERE to develop a Multi-Hazard Early Warning System to help respond more rapidly to extreme climate and weather events.

```
graph TD; A[Floods and storm surges] --- B[Forest Fires]
```

Floods and storm surges

Forest Fires

Chile

The worst forest fire in Chile's history - in pictures

Natural hazard modelling

EU project called ANYWHERE to develop a Multi-Hazard Early Warning System to help respond more rapidly to extreme climate and weather events.

```
graph TD; A[Floods and storm surges] --- B[Forest Fires]; B --- C[Drought];
```

Floods and storm surges

Forest Fires

Drought

Natural hazard modelling

EU project called ANYWHERE to develop a Multi-Hazard Early Warning System to help respond more rapidly to extreme climate and weather events.

Floods and storm surges

Forest Fires

Drought

Heatwaves and other extreme events

How do I model natural hazards?

E.g. calibration of fire danger levels to generate risk maps

Step 1

Collect from our databases information on historical distribution of vegetation, meteo&hydro variables

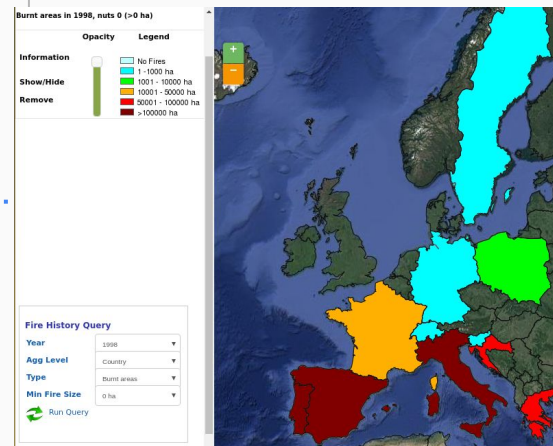

Step 2

Compare them with historical fire observations (from satellites).

Step 3

Generate fire danger levels and risk maps for damage assessment
